

Morphology view — where things are mounted
segment blocks · sensors inside (shape = modality, L upper / R lower) · CAZ glyph at each joint · anterior eye

Two-network view — the finalized grammar
mechanical body ⇄ DFN (differentiate + filter, α) ⇄ one broadcasting canvas (IN); the exchange is double-headed and no arrow runs canvas→actuator (C3)

CAZs regulate each other through the DFN — no central command drives the actuators (C3)

CAZ = one opponent pair = one DOF · split = bend axis · double-arrow = twist / telescoping · stack = more DOF or redundancy
